unfavourable factors, in comparison with control materials which remained in the laboratory over the same period. In experiments with bacteria 2ml. samples of suspensions of *Escherichia coli*, *Aerobacter aerogenes*, *Staphylococcus aureus* and *Clostridium butyricum* containing 500 million organisms or spores per ml. were sealed in ampoules, and exposed to a space flight of unstated duration; the number of viable individuals after the exposure did not differ significantly from the values for the control samples. A similar experiment was carried out with the T2 phage of *E. coli* and the 1321 phage of *A. aerogenes*, which were sent in the second satellite; again, no significant reduction in the titre of the phage preparations could be detected after return from space. Similar results were obtained with preparations of phage sent into space in the fourth and fifth satellites. Two bottles and six tubes of HeLa cells, some of which were saturated with oxygen, were exposed to space flight

The results of the . . .

conditions, after it had first been shown that vibration and acceleration did not detach the cells from the glass. The cultures without oxygen appeared normal on return, whereas in those exposed to oxygen most of the cells had degenerated. Subculture showed that 90% of the cells, whether detached from or remaining on the glass, were dead; however, two tubes gave good growth, and the cells which grew up showed no abnormalities of morphology. No antigenic differences could be detected in the cells in anaphylaxis and desensitization experiments in guinea-pigs. In subsequent space flights fibroblast and human amnion cell cultures were studied, with similar results. Pieces of human and rabbit skin were also used. On August 12th 1960 two pieces of skin 2.5 x 3.5 cm. in size and 0.5 mm. thick were taken from a human donor, placed in Hanks solution and sent into space in the second satellite. On recovery they were regrafted on the original site in the donor and became firmly attached after seven days.

f

Similar results were obtained with two other donors. An apparatus was devised for making a subculture in space, in order to study the ability of bacteria to multiply under space conditions. In experiments with *Glostridium butylicum* no deviations from the controls were observed. The second part of the work was devoted to a study of possible genetic effects brought about by exposure to space conditions, mainly by looking for the production of auxotrophic mutants and lysogeny in bacteria. The former were detected by inoculation on a layer of minimal medium which was then covered with an overlay of the same medium in order to fix the colonies. When the latter had grown up their position was noted and an overlay of complete medium was then put on, and the colonies which then grew up as a result of the diffusion of essential nutrients were selected as auxotrophic mutants. No such mutants could be found in suspensions of *Escherichia coli* recovered from the second satellite. The experiments on the induction of lysogenic bacteria were carried out on a strain of *E. coli* lysogenized by a λ phage which had been exposed to cosmic

Card 4/5

The results of the ---

radiation in the fifth satellite. Free phage particles were removed by adding phage antiserum; after the end of the latent period the action of the antiserum was cut short by diluting 1:100, streptomycin was added to inhibit the host organisms, and the mixture was plated out on the indicator strain in order to count the phage particles produced. The results obtained, considered in comparison with control experiments, provided no evidence of induction by cosmic radiation during a space flight of ninety minutes. No difference was observed in the plaque morphology. No changes could be detected in the chemical and physical properties of calf thymus deoxyribonucleic acid recovered after a space flight. The results as a whole indicate that no damage was suffered by isolated cells during a brief exposure to space conditions. There are 6 figures and 10 tables.

TITLE: Deflection of light rays in galactic gravitational fields

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 148, no. 4, 1963,
789-792

TEXT: The author suggests the measurement of the deflection of light of a galaxy G_1 by a galaxy G_2 which screens galaxy G_1 (see Figure) seen from point P. The equation for the light rays is

$$(dr/d\psi)^2 = (r + a)^4/b^2 - (r + a)(r - a) \quad (1)$$

where $a = \gamma M/c^2$, γ being the gravitational constant and M the mass of G_2 . The angle of deflection is $\psi = 4a/b$. Furthermore, the relations $4a/a_2(1 + k) = \delta^2$, $k = a_2/a_1$ are valid. The author discusses the possibilities of determining the necessary data experimentally. He deems it possible to prove general relativity experimentally by this

TITLE: Computing transition processes in the YaMZ-238 diesel engine on an M-3 electronic computer

SOURCE: Ref. zh. Dvigatelyi vnutrennego sgoraniya, Abs. 1.39.242

REF SOURCE: Tr. Tsentr. n.-i. avtomob. i avtomotorn. in-ta, vyp. 74, 1965, 34-48

TOPIC TAGS: data processing, engine component, diesel engine, electronic computer/YaMZ diesel engine, M-3 electronic computer

ABSTRACT: The agreement of results from computing transition processes in the YaMZ-238 engine with experimental data confirms the correctness of the computing investigation of a given non-linear system. Applying the computing method based on electronic computing machines and a ready-made standard program in engineering practice permits considerable decrease in experimental work in research and adjustment of automatic control systems of internal combustion engines.

AUTHOR: Klimov, Yu. G.

TITLE: Utilization of light deflection by the gravitational galactic fields in extragalactic astronomy.

SOURCE: AN SSSR. Doklady, v. 150, no. 1, 1963, 64-67

TOPIC CODE: gravitational galactic fields, extragalactic astronomy, photocells, photomultipliers

ABSTRACT: The light deflection in the gravitational field which is a consequence of the general theory of relativity can find practical application in extragalactic astronomy. One of the applications is the increase of the penetrating power of a telescope. It is shown that light coming from a distant galaxy produces a greater illumination when there is another galaxy between the telescope and the galaxy under study. Light deflected by the "screening" galaxy will be observed as a ring around the image of the latter. Expressions are derived for the illumination with and without the interposing galaxy. For the observation of the light rings which are due to light deflection, integrating devices such as photocells or photomultipliers must be used. The penetrating power of a 5 meter telescope utilizing light deflection is equivalent to that of a telescope of about 13 m. diam. without light.

Cord 1/2

L 12714-63

ACCESSION NR: AP3000293

deflection. The light deflection can also be used for determination of galactic masses or their distances, since the distance to a galaxy, the mass of the "screening" galaxy, and the angles of observation are interrelated. Original article has: 1 figure and 7 formulas.

TEXT: The article deals with the significance of the achievements of the 1959 Lenin Prizewinners: A.I. Leypunskiy, O.D. Kazachkovskiy, I.I. Bondarenko and L.N. Usachev for research into the physics of fast neutron nuclear reactors; S.M. Feynberg, V.V. Goncharov, G.A. Stoljarov, T.N. Zubarev, P.I. Khristenko, V. P. Kozlov and O.I. Lyubimtsev for their work in building the group of water-cooled research reactors BPP-2 (VVR-2), BPP-C (VVR-S) and MPT (IRT). The first group of scientists directed the construction of a series of fast neutron reactors: BP-1 (BR-1), BP-2 (BR-2), BP-3 (BR-3), BP-4 (BR-4) and BP-5 (BR-5). The BR-5, put into operation in 1958, may be regarded as the prototype of the future Soviet major atomic electric plants, designed around fast neutron reactors. The thermal output is 5,000 kw, which is at present used to produce steam for technological laboratory needs and for heating the buildings of the Fizicheskiy institut Gosudarstvennogo komiteta po ispol'zovaniyu atomnoy energii pri Sovete ministrov SSSR (Physics Institute, State Committee for the Use of Atomic Energy, Card 1/4

TITLE: The metallization of $B_{10}C_2H_{12}$ (Baren) and its derivatives with butyl lithium

SOURCE: AN SSSR. Izv. Seriya khimicheskaya, no. 12, 1963, 2236-2237

TOPIC TAGS: baren, baren ring, lithium derivative, monosubstitution, disubstitution, $B_{sub10}C_{sub2}H_{sub12}$, baren carboxylic acid, electron acceptor

ABSTRACT: In continuation of earlier papers on the synthesis of a new class of organo-boron compounds called barens of the following structural formula,

this report concerns lithium substitution for the hydrogen at C, resulting in mono- and disubstituted Li derivatives of baren, and monosubstitutions of Li in monoalkyl or monoaryl barens. These were transformed into the corresponding baren

TITLE: Nitration of barene

SOURCE: Zhurnal obshchey khimii, v. 35, no. 2, 1965, 394-395

TOPIC TAGS: barene, nitrobarene, organoboron compound, nitration

ABSTRACT: Nitration of barene with 100% HNO₃ at 20°C was used to obtain nitrobarene,

The melting point of the compound obtained was 100—101°C. The IR spectrum indicates the position of the nitro group at one of the carbon atoms of the barene ring. Nitration of phenylbarene results in substitution in the phenyl ring. Orig. art.

TITLE: The neobarene family

SOURCE: Zhurnal obshchey khimii, v. 36, no. 3, 1966, 432-436

TOPIC TAGS: organoboron compound, halogenation

ABSTRACT: The article describes a new class of organic compounds, the neocarboranes, which the authors refer to as neobarenes and represent by the symbol .

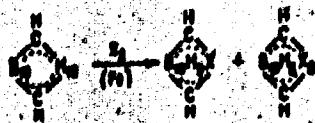

The neobarenes are very similar to barenes in properties and differ chiefly in IR spectra, lower melting points, and certain differences in chemical properties. Like barenes, the compounds neobarene, neomethylbarene, neophenylbarene, neochlorobarene, neobromobarene, and neiodobarene can be vacuum-distilled at 70-125°C. Their melting points are 10-30°C below those of the corresponding barenes. Electrophilic chlorination, bromination, and iodination of neobarenes involves the penetration of two halogen atoms into the boron ring:

TITLE: X-ray diffraction of some derivatives of borane and neoborane

SOURCE: Zhurnal strukturnoy khimii, v. 6, no.6, 1965, 923-925

TOPIC TAGS: inorganic synthesis, borane, crystal structure, x ray diffraction

ABSTRACT: The crystalline structure of a series of boranes and neoboranes was studied by X-ray diffraction. The cell parameters, density, spatial configuration, and crystal forms were tabulated for B-dichloroborane, B-bromoborane, B-iodoborane, B-diiodoborane, B-triiodoborane, B-dichloro-C-methylborane, B-trichloro-C-methylborane, B-dibromo-C-methylborane, I-bromo-2-borenylethane, C-(p-bromophenyl)borane, bis(C-vinylborenyl)mercury, C-vinylborenyl methyl mercury, B-iodoneoborane, B-diiodoneoborane, and B-deca-chloroneoborane. The authors express their gratitude to R. L. Avoyan for assistance in the X-ray study and to V. I. Bregadza for preparation of the two mercury compounds. Orig. art. has: 1 table.

TITLE: m-Dibarenyl

SOURCE: Zhurnal obshchey khimii, v. 36, no. 12, 1966, 2219

TOPIC TAGS: carborane, isomerization, carborane condensation, boron compound

ABSTRACT: Heating of o-carborane to 580–600°C for 12 hr resulted not only in the isomerization of o-carborane to m-carborane, but also in the simultaneous condensation of m-carborane nuclei to form "m-dibarenyl" (mp, 216–218°C). In addition to m-dibarenyl, products with 3, 4 or more barenyl nuclei were formed. m-Dibarenyl was also formed on heating m-carborane under similar conditions.

The apparatus, experimental procedure, and IR spectra of m-dibarenyl

B

TITLE: The effect of impurities and structure on the linear expansion coefficient
of commercial Ti

SOURCE: Metallovedeniye i termicheskaya obrabotka metallov, no. 5, 1965, 29-32

TOPIC TAGS: titanium, metal physical property, coefficient of thermal expansion

ABSTRACT: Ingots were cast from commercially pure Ti and alloyed with Fe, Cr, C and O. The linear expansion coefficient, α_l , was then determined by a special dilatometer. No change in α_l was noted within the accuracy of the experiment, when alloying elements, including C and O, were added. The measurements were made over a wide range of temperatures (20-800°C). Changes in grain size were studied for annealing temperatures at and below 800°C. Both very large and very small grain sizes were obtained by varying the time of annealing. The large grains had the greatest effect in increasing α_l in the experimental temperature range. Small grain

Card 1/2

L 57510-65

ACCESSION NR: AP5013154

size thus results in greater stabilization of α_1 in Ti. Various treatments in the a and β regions were followed by microstructural analysis and α_1 determinations. However, this resulted in a coarse grain structure, and the influences noted above took effect. The results do show some reduction in the expansion coefficient due to the microstructure. Finally, the authors consider the effects of cold deformation (26-53%) on the value of α_1 . In the temperature range of 20-100°C, α_1 was raised from 4.29×10^{-6} to 10.2×10^{-6} by cold deformation to 53%. Orig. art. has: 3 figures, 3 tables.

TITLE: Activity of alpha-amylase and glucose-6-phosphatase of the liver and the blood
sugar content in animals with plague intoxication

SOURCE: Byulleten' eksperimental'noy biologii i meditsiny, v. 60, no. 8, 1965, 61-64

TOPIC TAGS: enzyme, liver, toxicology, blood, carbohydrate, mouse, rat

ABSTRACT: The experiments described in this article were carried out to determine the effect of P. pestis toxin on the activity of hepatic alpha-amylase and glucose-6-phosphatase; to determine also the blood sugar during the various periods of plague intoxication; and to study at the same time the dynamics of the development of hypoglycemia in the latter stages of the disease. Albino mice 18-20 grams and albino rats 180-200 grams in weight were used in the experiments. A preparation of fraction II obtained by the Baker method from P. pestis (the LD₅₀ for albino mice is 1.8 and for albino rats, 8 micrograms). The toxin was administered to the animals intraperitoneally in doses of one LD₅₀ to the mice, and 10 LD₅₀ to the rats. The mice were sacrificed 17 hours after administration of the plague toxin, and the rats — within 2 hours after administration of the toxin. The liver was

excised, reduced to a powder, and placed in chilled physiological solution. Tests, the Rutter-Brosmer for amylase and the Dost and Ostrovskiy for glucose-6-phosphatase, established that plague toxin had no effect on the activity of hepatic alpha-amylase and glucose-6-phosphatase in either the mice or the rats. The blood sugar at various periods of plague intoxication was studied in rats, which were for this purpose divided into three groups. The first two groups were administered the plague toxin in a dose of LD₅₀. Blood was taken from these animals every 30 minutes for a period of 2 hours and examined for its sugar content. At the end of this period the animals of the second and third (control) groups were intraperitoneally administered adrenalin in a dose of 50 micrograms. The blood content of sugar was determined within 10, 20, 30, 60, and 120 minutes after the administration of adrenalin. It was found that the blood sugar in the rats remained unchanged during the early stages of plague intoxication; in later stages and in the agonal period however, hypoglycemia developed, due probably to the exhaustion of sugar reserves in the liver. This paper was presented by N. M. Zhukov-Verezhnikov, Active Member, AMN SSSR. [Orig. arch. has 2 figures and 1 table. [USSR]]
